

DO THE RESEARCH! Don't rely entirely on what the internet claims will work for a certain climate or growing environment. Talk directly with plant breeders and learn about the varieties they produce. Ask about:

- History of the genetics—where they were developed, the evolution of the development, cannabinoid content, germination rate, etc.
- Testing and treatment protocols for dealing with diseases.
- Seed certification and feminization reports.
- Where seeds or cuttings/clones are produced—indoor, outdoor or in a greenhouse.
- Variety's success in your region and micro-climate.

Flower response time—will it work for daylight sequence at your site(s).

For example, one variety recommends:

Maturity week: Minimum 4 weeks vegetation recommended, 7-9 weeks to Harvest.

- Also ask if they are a grower source, or, if they are a broker source. Direct grower sources should already have the variety documentation (COAs) required by the ADAI lab, while a broker source is required to provide the variety documentation from the grower along with linking documents verifying purchase(s) back to the grower. All sources are required to be currently licensed in their state of operation as well as in Alabama.
